To what extent was the shift to agriculture among certain Neolithic populations a conscious choice?

Thesis: What was originally an unconscious decision, shifting to agriculture must have been a conscious ~~decision~~ choice at one point because it requires staying in one place for a long time rather than moving ~~around~~ around throughout the year.

Supporting Arguments:

- 1.) Staying in one place and committing to agriculture requires deciding to stay in one place for the year.
- 2.) Using agriculture to supplement an existing diet by choosing which foods to plant requires deciding to do so.
- 3.) If a nomadic society came back to specific places every year, they would have observed the same plants coming back year after year and gradually reduced the area covered every year in order to obtain more food from less fewer areas.
